

TOOL BOX

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to a tool box, and more particularly to a
5 removable tool box that facilitates the user removing the hand tool, so that the
user can take the hand tool from the tool box easily and rapidly.

2. Description of the Related Art

A conventional tool box comprises a main body having a plurality of
receiving portions for receiving and clamping the hand tools, such as the
10 screwdriver tips or the like, and a cover pivotally mounted on the main body.
Thus, the user can remove the hand tools from the receiving portions of the
main body by pivoting the cover outward relative to the main body. However,
the receiving portions are fixed in the main body without movement, thereby
causing inconvenience to the user when removing the hand tools from the
15 receiving portions of the main body.

SUMMARY OF THE INVENTION

The primary objective of the present invention is to provide a tool
box that facilitates the user removing the hand tool, so that the user can take the
hand tool from the tool box easily and rapidly.

20 Another objective of the present invention is to provide a tool box,
wherein when the top cover is entirely removed from the base, the receiving

rack is lifted to the optimum inclined position, so that the user can take the screwdriver tips from the receiving rack easily and conveniently.

A further objective of the present invention is to provide a tool box, wherein the fixed block and the movable block of the receiving rack are
5 separated from each other by the restoring force of the two elastic plates so as to form a larger space, thereby facilitating the user removing the screwdriver tips from the fixed block and the movable block of the receiving rack.

A further objective of the present invention is to provide a tool box, wherein the secondary receiving rack is moved in concert with the receiving
10 rack by connection of the link, thereby facilitating the user removing the screwdriver tips from the secondary receiving rack.

In accordance with the present invention, there is provided a tool box, comprising:

- a base;
- 15 a top cover pivotally mounted on the base;
- a receiving rack pivotally mounted in the base for receiving a plurality of hand tools; and
- a driving lever pivotally mounted in the base and having a first end connected to and driven by the top cover and a second end connected to the
20 receiving rack for moving the receiving rack.

Further benefits and advantages of the present invention will become apparent after a careful reading of the detailed description with appropriate reference to the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

5 Fig. 1 is a perspective view of a tool box in accordance with the preferred embodiment of the present invention;

Fig. 2 is an exploded perspective view of the tool box as shown in Fig. 1;

Fig. 3 is a side plan cross-sectional view of the tool box as shown in
10 Fig. 1;

Fig. 4 is a schematic operational view of the tool box as shown in Fig. 3 in use;

Fig. 5 is a schematic operational view of the tool box as shown in Fig. 1 in use;

15 Fig. 6 is a schematic operational view of the tool box as shown in Fig. 4 in use;

Fig. 7 is a plan cross-sectional view of a tool box in accordance with another embodiment of the present invention;

Fig. 8 is a schematic operational view of the tool box as shown in Fig. 7 in use;

Fig. 9 is a plan cross-sectional view of a tool box in accordance with another embodiment of the present invention; and

Fig. 10 is a schematic operational view of the tool box as shown in Fig. 9 in use.

DETAILED DESCRIPTION OF THE INVENTION

Referring to the drawings and initially to Figs. 1-3, a tool box in accordance with the preferred embodiment of the present invention comprises a base 40, a top cover 30 pivotally mounted on the base 40, a receiving rack 50 pivotally mounted in the base 40 for receiving a plurality of hand tools, such as the screwdriver tips 59, and a driving lever 60 pivotally mounted in the base 40 and having a first end connected to and driven by the top cover 30 and a second end connected to the receiving rack 50 for moving the receiving rack 50.

The receiving rack 50 includes a fixed block 51 pivotally mounted in the base 40, and a movable block 55 pivotally mounted on the fixed block 51.

The base 40 has two sides each formed with a through hole 41, the top cover 30 has two sides each formed with a driving hole 31, the first end of the driving lever 60 is formed with a driven hole 62, the fixed block 51 of the receiving rack 50 has two sides each formed with a through hole 53, and the tool box further comprises two pivot shafts 20 each extended through the respective through hole 41 of the base 40, the respective driving hole 31 of the top cover 30 and the respective through hole 53 of the fixed block 51 of the receiving rack 50, and the driven hole 62 of the driving lever 60 is secured on one of the two pivot shafts 20, so that when the top cover 30 is pivoted relative to the base 40, each of the two pivot shafts 20 is rotated by the respective

driving hole 31 of the top cover 30 to rotate the driven hole 62 of the driving lever 60 so as to rotate the driving lever 60.

Preferably, the driving hole 31 of the top cover 30 has an oblong shape, the driven hole 62 of the driving lever 60 has an oblong shape, and each
5 of the two pivot shafts 20 has an oblong shape. In addition, each of the two pivot shafts 20 has a first end formed with an enlarged head 22 rested on a wall of the respective through hole 41 of the base 40 and a bifurcated second end formed with two flexible locking hooks 23 each rested on a wall of the respective through hole 53 of the fixed block 51 of the receiving rack 50.

10 The fixed block 51 of the receiving rack 50 has a top provided with an arc-shaped elastic plate 52, and the movable block 55 of the receiving rack 50 has a bottom provided with an arc-shaped elastic plate 520 rested on the elastic plate 52 of the fixed block 51 of the receiving rack 50.

The fixed block 51 of the receiving rack 50 has two sides each
15 formed with a through hole 54 and a slide slot 56, and the movable block 55 of the receiving rack 50 has two sides each formed with a pivot axle 57 pivotally mounted in the through hole 54 of the fixed block 51 of the receiving rack 50 and a slide slot 560 aligning with the slide slot 56 of the fixed block 51 of the receiving rack 50. In addition, the slide slot 560 of the movable block 55 of the
20 receiving rack 50 has an upper limit 562, and the first end of the driving lever 60 is formed with a stub 61 slidable in the respective slide slot 56 of the fixed block 51 of the receiving rack 50 and the respective slide slot 560 of the

movable block 55 of the receiving rack 50 to abut the upper limit 562 of the respective slide slot 560 of the movable block 55 of the receiving rack 50.

Each of the two sides of the fixed block 51 of the receiving rack 50 is provided with a resting face 510, and each of the two sides of the movable
5 block 55 of the receiving rack 50 is provided with an urging face 550 rested on the resting face 510 of the fixed block 51 of the receiving rack 50 when the movable block 55 of the receiving rack 50 is pivoted relative to the fixed block 51 of the receiving rack 50 to a determined angle.

The tool box further comprises a secondary receiving rack 50A
10 pivotally mounted in the base 40 and connected to the receiving rack 50 by a link 70. The link 70 has two ends each provided with a locking portion 71 inserted into a through hole 58 formed in the movable block 55 of the receiving rack 50 and a through hole 58A formed in the movable block 55A of the secondary receiving rack 50A.

15 In operation, referring to Figs. 1-6, the top cover 30 is initially parallel with the base 40 as shown in Fig. 3. At this time, the stub 61 of the driving lever 60 is received in the respective slide slot 56 of the fixed block 51 of the receiving rack 50 as shown in Fig. 3.

When the top cover 30 is rotated relative to the base 40, the stub 61 of
20 the driving lever 60 is slidable in the respective slide slot 56 of the fixed block 51 of the receiving rack 50 and the respective slide slot 560 of the movable block 55 of the receiving rack 50.

When the top cover 30 is rotated relative to the base 40 to the position as shown in Fig. 4 where the included angle between the top cover 30 and the base 40 is about 45 degrees, the stub 61 of the driving lever 60 is rested on the upper limit 562 of the respective slide slot 560 of the movable block 55 of the receiving rack 50.

When the top cover 30 is further rotated relative to the base 40, the receiving rack 50 is driven by the stub 61 of the driving lever 60 to move upward relative to the base 40.

Thus, when the top cover 30 is rotated relative to the base 40 to the position as shown in Figs. 5 and 6 where the included angle between the top cover 30 and the base 40 is about 90 degrees, the receiving rack 50 is moved by the stub 61 of the driving lever 60 to a position where the included angle between the receiving rack 50 and the base 40 is about 45 degrees.

At this time, the fixed block 51 and the movable block 55 of the receiving rack 50 are separated from each other by the restoring force of the two elastic plates 52 and 520, thereby facilitating the user removing the screwdriver tips 59 from the fixed block 51 and the movable block 55 of the receiving rack 50.

In addition, when the movable block 55 of the receiving rack 50 is moved by the stub 61 of the driving lever 60, the pivot axle 57 of the movable block 55 of the receiving rack 50 is pivoted in the through hole 54 of the fixed block 51 of the receiving rack 50, so that the movable block 55 of the receiving

rack 50 is pivoted relative to the fixed block 51 of the receiving rack 50 until the urging face 550 of the movable block 55 of the receiving rack 50 is rested on the resting face 510 of the fixed block 51 of the receiving rack 50. Then, the fixed block 51 and the movable block 55 of the receiving rack 50 are moved by the stub 61 of the driving lever 60 simultaneously.

Accordingly, when the top cover 30 is entirely removed from the base 40 as shown in Fig. 6, the receiving rack 50 is lifted to the optimum inclined position, so that the user can take the screwdriver tips 59 from the receiving rack 50 easily and conveniently. In addition, the fixed block 51 and the movable block 55 of the receiving rack 50 are separated from each other by the restoring force of the two elastic plates 52 and 520 so as to form a larger space, thereby facilitating the user removing the screwdriver tips 59 from the fixed block 51 and the movable block 55 of the receiving rack 50. Further, the secondary receiving rack 50A is moved in concert with the receiving rack 50 by connection of the link 70, thereby facilitating the user removing the screwdriver tips 59 from the secondary receiving rack 50A.

Referring to Figs. 7-10, the tool box further comprises a snapping member 80 mounted on a surface of the base 40, so that the tool box can be attached on the user's waist belt 82.

Although the invention has been explained in relation to its preferred embodiment(s) as mentioned above, it is to be understood that many other possible modifications and variations can be made without departing from the

scope of the present invention. It is, therefore, contemplated that the appended claim or claims will cover such modifications and variations that fall within the true scope of the invention.
